

ujust commands

ujust is a Bazzite tool that turns common maintenance and troubleshooting tasks into short, memorable commands, typed into a terminal as the word ujust followed by the command name. Typing ujust by itself, with nothing after it, lists every command available, and a graphical app called Bazzite Portal offers many of the same commands as clickable buttons for anyone who'd rather avoid the terminal entirely.

update	Updates the system, all Flatpak apps, and any containers, all in one go, instead of updating each separately.
device-info	Gathers useful information about your system into a shareable link, handy when asking for help somewhere.
logs-this-boot	Shows all system messages from the current session, useful for tracking down what went wrong after something misbehaves.
fix-reset-steam	Resets Steam back to a fresh state without touching your games, saves, or library, useful if Steam itself is acting up.
fix-proton-hang	Force-closes any stuck Proton or Wine processes, useful when a game fails to close properly and won't let you relaunch it.
restart-pipewire	Restarts the audio system, a quick fix for crackling or broken sound.
clean-system	Clears out old, unused container images, Flatpak leftovers, and update data to free up disk space.
enroll-secure-boot-key	Registers the driver signing key needed to use Secure Boot with an Nvidia graphics card.
bios	Reboots the computer straight into its BIOS or UEFI firmware screen, skipping the usual boot process.
regenerate-grub	Rebuilds the boot menu so Windows shows up properly alongside Bazzite, useful after installing Windows on a dual-boot setup.
setup-boot-windows-steam	Adds a shortcut inside Steam that reboots straight into Windows, a convenience for dual-boot setups.
enable-tailscale	Turns on support for Tailscale, the private networking tool.
setup-decky	Installs and configures Decky Loader, a plugin system for Steam's Gaming Mode.
bazzite-cli	Adds a more informative, nicer-looking terminal prompt style.
ujust --choose	Not a single task, this opens an interactive menu of every available command, worth remembering on its own if none of the specific names above stick.

Run any of these by typing ujust followed by the command name, for example `ujust update`.
