

ujust commands

ujust is a Bazzite tool that turns common maintenance and troubleshooting tasks into short, memorable commands, typed into a terminal as the word `ujust` followed by the command name. Typing `ujust` by itself, with nothing after it, lists every command available, and a graphical app called Bazzite Portal offers many of the same commands as clickable buttons for anyone who'd rather avoid the terminal entirely.

<code>update</code>	Updates the system, all Flatpak apps, and any containers, all in one go, instead of updating each separately.
<code>device-info</code>	Gathers useful information about your system into a shareable link, handy when asking for help somewhere.
<code>logs-this-boot</code>	Shows all system messages from the current session, useful for tracking down what went wrong after something misbehaves.
<code>fix-reset-steam</code>	Resets Steam back to a fresh state without touching your games, saves, or library, useful if Steam itself is acting up.
<code>fix-proton-hang</code>	Force-closes any stuck Proton or Wine processes, useful when a game fails to close properly and won't let you relaunch it.
<code>restart-pipewire</code>	Restarts the audio system, a quick fix for crackling or broken sound.
<code>clean-system</code>	Clears out old, unused container images, Flatpak leftovers, and update data to free up disk space.
<code>enroll-secure-boot-key</code>	Registers the driver signing key needed to use Secure Boot with an Nvidia graphics card.
<code>bios</code>	Reboots the computer straight into its BIOS or UEFI firmware screen, skipping the usual boot process.
<code>regenerate-grub</code>	Rebuilds the boot menu so Windows shows up properly alongside Bazzite, useful after installing Windows on a dual-boot setup.
<code>setup-boot-windows-steam</code>	Adds a shortcut inside Steam that reboots straight into Windows, a convenience for dual-boot setups.
<code>enable-tailscale</code>	Turns on support for Tailscale, the private networking tool.
<code>setup-decky</code>	Installs and configures Decky Loader, a plugin system for Steam's Gaming Mode.
<code>bazzite-cli</code>	Adds a more informative, nicer-looking terminal prompt style.
<code>ujust --choose</code>	Not a single task, this opens an interactive menu of every available command, worth remembering on its own if none of the specific names above stick.

Run any of these by typing `ujust` followed by the command name, for example `ujust update`.
